

ZM223

Avery Weigh-Tronix

Auto Lock Software Application

Overview

With its IP69K robust stainless-steel enclosure and large easy-to-read LCD display, this indicator can be used for weighing livestock in remote locations.

The auto lock program provides a fast and simple solution that can be controlled by a single farmhand.

Auto lock functions by setting an initial threshold weight. As the animal steps onto the scale, the ZM223 Indicator quickly averages and locks onto an accurate weight. Providing an easily viewed and printable weight.

The locked weight will remain until the live weight drops below a configured threshold, or it will wait until the next animal is on the scale.

Key benefits

The ZM223 has the speed and accuracy to quickly lock onto an animal's weight despite their **unpredicted movement**.

Designed for efficiency and **ease-of-use**, the auto lock application can be handled by one person without any hassle.

Robust options to **increase operational output** via auto print and auto accumulation features.

The ZM223 is designed for **outdoor and rugged use** like animal weighing, as it has been tested and certified IP69K rated.

Use the **Remote Assist™ Mobile App** to remotely print, accumulate, and configure thresholds.

Application Features

Internal Data Storage

Designed for use by a single farmhand, the ZM223 can record valuable weight data directly onto its internal database just by pressing the print key.

Controlling Animal IDs with the ZM Mobile App

Unlike other simple animal weighing indicators on the market today, the ZM223 allows the operator to enter in other valuable information like the animal ID numbers, names, time & date and operator ID. All of which can be recorded along with the weight data transaction stored within the ZM223.

The Avery Weigh-Tronix Remote Assist™ Mobile App allows the operator to quickly enter in the UDF field data directly from the phone app prior to pressing the print key.

Retrieving Internal Data

Retrieving data directly from the ZM223 at the end of the day can be as simple as plugging a USB memory stick into the bottom of the indicator or by pairing the indicator directly to the Remote Assist™ Mobile App or tablet using Bluetooth®. Both methods take seconds to complete.

If uploaded to a phone in a CSV file format, this data can then easily be viewed within a spreadsheet or emailed directly from the phone to another device like a PC.
